

TASK 1 : Short Reflection

Q) Why is .env better than writing passwords in code?

1. Allows us to change different passwords, APIs etc without having to change the code.
2. Helps to prevent sensitive information such as passwords and APIs from going public or being pushed to sites like Github.
3. Centralization and easier maintenance.
4. Maintains the factor 3 of the Twelve-Factor App.

Q) Why is treating the database as a separate service useful?

1. Separates the data from the application code, allowing us to upgrade the database without rewriting our app.
2. Easier scalability.
3. Prevents the application and the database from fighting over the same CPU or memory as each service runs in its own isolated environment.
4. Maintains the factor 4 of the Twelve-Factor App.

Q) Why does Docker make development and production similar?

—> Docker provides us with a container where we can package our application along with all its dependencies. We can convert that container/package into a Docker image, which is a lightweight portable version. This image works the same on all other devices; in this way, Docker makes development and production similar.
